Problem:

Write a web application that takes a two dimensional array and returns a string. The array may be of arbitrary size (each subarray will be the same size, however) and must consist of uppercase English letters. The returned string must consist of all elements of the array ordered in a clockwise spiral pattern starting with element [0, 0]. Each letter must be converted to lowercase and separated by a single whitespace character.

For example, given the following array:
[[A B C D]
[E F G H]
[I J K L]]
The resulting string would be: "a b c d h l k j i e f g"
